

☆☆☆ Day 139 ☆☆☆

of Our Daily UiPath Q&A Challenge!

Welcome to Day 139 of our exciting
UiPath Q&A Challenge! Each day,
we'll be answering one key question
to help you master UiPath and
revolutionize your automation
journey. 🚀

🚫 Question for Today

How do you set the name of a
worksheet when writing data to
Excel?

To set the name of a worksheet when writing data to Excel in UiPath (Modern activities), you specify the sheet name directly in the activity.

✓ Using Excel Activities

◆ Inside Use Excel File, use:

- Write Range or
- Write DataTable to Excel

Each has a SheetName property where you can set the desired worksheet name.

If the sheet doesn't exist, UiPath will create it automatically.

Notes:

- If a sheet with the same name already exists, it will overwrite content starting from the specified cell. You can set Append property - true to append data to existing data.
- You can set SheetName dynamically using variables (e.g., "Summary_" + Now.ToString("yyyyMM")).
